

World Biomes Match and Draw

Draw **one** line from the biome type to the correct description.

tundra

An open region that is mostly covered by grass and has a warm and dry climate. This type of biome is found on every continent, except Antarctica.

desert

A very cold region where a thick layer of ice lies beneath the soil all year round, meaning that trees cannot grow. This type of biome is common in Arctic and Antarctic regions.

grassland

A very dry region that receives less than 50cm of rainfall per year. This type of biome can be very hot or very cold. The Sahara is a well-known example of this type of biome.

rainforest

A type of grassland that is close to the equator. It is hot all year round with some scattered trees. This type of biome covers almost half of the continent of Africa.

savanna

A type of forest that experiences all four seasons. Deciduous trees (trees that lose their leaves in winter) are common here.

taiga

A type of forest that is located close to the equator and has a warm and humid climate. The Amazon is a well-known example of this type of biome.

temperate
forest

A type of forest that experiences cold temperatures for most of the year and has mainly coniferous trees. Animals such as foxes, moose, deer and bears have adapted to the climate of this biome.
