

If... Then... Coding Examples

We know that coding uses **conditional statements** to make decisions. These are the basic instructions that tell a device what to do and when to do it. For example, **If** I tap the side of my headphones, **then** it will pause the music.

Can you think of an if/then statement for your technology?

1. **If** I click the letter icon, **then** the mail app will open.

2. **If** _____,
then _____.

3. **If** _____,
then _____.

4. **If** _____,
then _____.

Imagine you could add any feature you wanted to your phone, laptop, or other device. How could you write this as a conditional statement?
