Biologists analysing the spread of feral animals in outback Western Australia note that the rate of growth of the population of a species of European Wild rabbit (*Oryctolagus cuniculus*) is proportional to its population at any time. The approximate number of rabbits at the start of 2000 was 850 000 and the continuous percentage growth rate is 2.5% per year.

(a) Determine the equation relating the population (P) of the rabbits to the time (t) years after the beginning of 2000. (2)

$$P = 850000\, e^{0.025t} \quad ✓✓$$

(b) Find the population of the rabbits at the beginning of 2016, to the nearest 100 rabbits. (2)

$$P = 850000\, e^{0.025(16)} = 1268050.993$$
$$✓ \qquad = 1268100 \quad ✓$$

(c) What is the instantaneous rate of growth of the number of rabbits at the start of 2016? (2)

$$\frac{dP}{dt} = 0.025P \; ✓ = 0.025 \times 1268050.993$$
$$= 31701 \quad ✓$$

(d) In order to control the rapid growth of the feral rabbits, the *myoxama* virus was introduced at the beginning of 2016. The population decay after the virus was introduced is modelled by $\frac{dP}{dt} = -0.185P$, where P is the population after the beginning of 2016. (4)

In what year will the rabbit population be reduced to less than 250000.

$$250000 = 1268050\, e^{-0.185t} \quad ✓$$
$$t = 8.78 \quad ✓$$

During 2024 the population of rabbits will fall to below 250000. ✓✓

A particle is moving in rectilinear motion such that velocity, *m/min* at any time, *t* minutes , is given by:

$$v(t) = 4t^3 - 12t^2 + 6t + 4$$

If the particle begins 4 metres to the left of the origin, determine:

(a) When the particle stops. (2)

$4t^3 - 12t^2 + 6t + 4 = 0$ ✓

$t = 1.37$ min and 2min. ✓

(b) The displacement at any time *t*. (2)

$x = \int v(t)\, dt$

$= \int 4t^3 - 12t^2 + 6t + 4\, dt$

$= t^4 - 4t^3 + 3t^2 + 4t + c.$ ✓

When $t = 0$, $x = -4$.

$\therefore c = -4$.

$x = t^4 - 4t^3 + 3t^2 + 4t - 4$. ✓

(c) The acceleration as the particle passes through the origin. (3)

$a = \frac{d}{dx} v(t)$.

$= 12t^2 - 24t + 6$ ✓

$x = 0$, when $t = 1$ and 2 ✓

$A(1) = -6$ m/min^2 ✓

$A(2) = 6$ m/min^2

(d) The total distance travelled by the particle in the first two minutes. (2)

Total Distance $= \int_0^2 |4t^3 - 12t^2 + 6t + 4|\, dt$. ✓

The rate of change in temperature $°C$ in a steel bar at any time t minutes after an initial reading is given as:

$$\frac{dT}{dt} = 10 + \frac{300}{(t+1)^3} \quad where\ t > 0$$

The temperature of the bar one minute after the initial reading in 80°C.

Determine:

(a) The change in the temperature of the bar during the second minute. (2)

$$\int_1^2 10 + \frac{300}{(t+1)^3}\, dt = 30.83°C.$$

✓ ✓

(b) The temperature of the bar at any time t. ✓ (2)

$$T = \int 10 + \frac{300}{(t+1)^3} = 10x - \frac{150}{(x+1)^2} + c.$$

when $T = 80°C$ $t = 1$.

$$\therefore 80 = 10x - \frac{150}{(x+1)^2} + c.$$

$$c = 107.5.$$

✓

$$\therefore T = 10x - \frac{150}{(x+1)^2} + 107.5.$$

A particle, initially at rest at a displacement of 1 metre from the origin 0, moves in a straight line so that its velocity $v\ metres/\sec after\ t\ seconds$ is given by the equation

$$v = 3\cos t - \sin t$$

a. If after $time\ t$, the $displacement\ is\ x\ metres$ and the $acceleration\ is\ a\ metre/sec^2$, show that $x + a = 0$ (4)

$x = \int v(t)\,dt.$

$= 3\sin t + \cos t + C.$

when $t=0, x=1$

$1 = 3\sin 0 + \cos 0 + C$

$C=0$ ✓✓
